## (54) BAR-CODE READER

(57)Abstract:

**PROBLEM TO BE SOLVED:** To increase the memory capacity and processing power of a computer resource for reading out PDF 417 bar-code symbol.

**SOLUTION:** A portable self-standing two-dimensional bar-code reader for PDF 417 bar-code symbol incorporated with a light source 16, photodetector 17, and a decoder 64. The decoder 64 is provided with an 8k-byte SRAM 42 for storing data and a novel 32k-byte PEROM 45 for storing program instruction and the performance of the bar-code reader is improved by DMA-transferring signals to the memories from the photodetector 17. The average electric power consumed by the reader during read-out operation while the light source is turned on is 1.4 watt and that during decoding operation while the light source is tuned off is 0.83 watt. The reader can read out 800 PDF 417 bar-code symbols within about two seconds at the error correcting level '5'.

## CLAIMS

---

### [Claim(s)]

- [Claim 1] The light source which irradiates the two-dimensional bar code symbol (400,500,600) which has encoded data in it (16), The photodetector which generates the signal which answers the light reflected from said two-dimensional bar code symbol (400,500,600) (17), It has the decoder (40 64) connected so that said signal from said photodetector (17) might be received. In the bar code reader of the type it was made to output the signal with which said decoder (40 64) contains the data with which said two-dimensional bar code symbol was decoded The 1st part which has the program (list No.1) which resides permanently in order that said decoder (40 64) may decode a two-dimensional bar code symbol, and which can be performed (45), The bar code reader of the independence type characterized by having the microcomputer (30) which has the memory (42 45) containing the 2nd part (42) for holding data.
- [Claim 2] The bar code reader of the independence type according to claim 1 which contains further the direct memory access channel (48) connected to said memory (42 45) and said photodetector (17).
- [Claim 3] Said two-dimensional bar code symbol (400,500,600) is the bar code reader of the independence type according to claim 2 which is PDF417 symbol.
- [Claim 4] Said microcomputer (30) is the bar code reader of the independence type according to claim 1 which has the address space which does not exceed 64 K bytes.
- [Claim 5] Said 1st part (45) of said memory (42 45) is the bar code reader of an independence type [ equipped with the read only memory (45) with the capacity which does not exceed 32 K bytes ] according to claim 4.
- [Claim 6] Said 2nd part (42) of said memory (42 45) is the bar code reader of an independence type [ equipped with random access memory (42) with the capacity which does not exceed 8 K bytes for data storage ] according to claim 4.
- [Claim 7] Said 2nd part (42) is the bar code reader of an independence type [ equipped with SRAM ] according to claim 6.
- [Claim 8] Said light source (16) is the bar code reader of an independence type [ equipped with raster rye gin grazer (116) ] according to claim 1.
- [Claim 9] Said photodetector (17) is the bar code reader of an independence type [ equipped with the linear CCD array (17) ] according to claim 1.
- [Claim 10] Said photodetector (17) is the bar code reader of an independence type [ equipped with the two-dimensional CCD matrix (117) ] according to claim 1.
- [Claim 11] The light source which irradiates the two-dimensional bar code symbol (400,500,600) which has encoded data in it (16), The photodetector which generates the signal which answers the light reflected from said two-dimensional bar code symbol (400,500,600) (17), It has the decoder (40 64) connected so that said signal from said photodetector (17) might be received. In the bar code reader of the type it was made to output the signal with which said decoder (40 64) contains the data with which said two-dimensional bar code symbol was decoded The 1st memory which stores the program (list No.1) in which the activation for decoding a two-dimensional bar code symbol is possible (45), The microcomputer which has the 2nd memory (42) for storing data (30), It has further the direct memory access channel (48) of said microcomputer (30) which controls storing in said 2nd memory (42) of said signal outputted from said photodetector. Said microcomputer (30) has the address space which does not exceed 64 K bytes. Said 1st memory (45) is a portable hand carry type two-dimensional bar code reader which has the capacity which does not exceed 32 K bytes and is characterized by said 2nd memory (42) having the capacity which does not exceed 8 K bytes.
- [Claim 12] A bar code reader is a portable hand carry type two-dimensional bar code reader according to claim 11 which may do not consume from 1.4W on an average, but has the weight which does not exceed 225g during read-out actuation.
- [Claim 13] Said two-dimensional bar code symbol (400,500,600) is a portable hand carry type two-dimensional bar code reader according to claim 11 which is PDF417 symbol.

automatic discernment program for discernment between a linear bar code symbol and PDF417 symbol according to claim 13.

[Claim 15] Said light source (16) is a portable hand carry type two-dimensional bar code reader according to claim 11 which supports the strip by which the field of view of said photodetector (17) was irradiated by irradiating the strip of a two-dimensional bar code symbol.

[Claim 16] Said light source (16) is a portable hand carry type two-dimensional bar code reader [ equipped with two or more light emitting diodes ] according to claim 11.

[Claim 17] Said light source (16) is a portable hand carry type two-dimensional bar code reader according to claim 11 which is raster yie gin grazer (116).

[Claim 18] Said photodetector (17) is a portable hand carry type two-dimensional bar code reader [ equipped with the linear CCD array (17) ] according to claim 11.

[Claim 19] Said photodetector (17) is a portable hand carry type two-dimensional bar code reader [ equipped with the two-dimensional CCD matrix (117) ] according to claim 11.

## DETAILED DESCRIPTION

---

[Detailed Description of the Invention]

[0001]

[Field of the Invention] This invention relates to a two-dimensional bar code reader. Furthermore, this invention relates to the bar code reader of an independence type like PDF417 which can read thoroughly both a 1-dimensional bar code symbol and a two-dimensional bar code symbol, and can be decoded at a detail.

[0002]

[Description of the Prior Art] The bar code reader of an independence type is well known for this field. The newest example is the model of ST3000 proposed by these people. This kind of bar code reader has the microcomputer [reading / a linear bar code symbol like the UPC code currently used widely at the supermarket or the similar retail store or a code 39 / microcomputer / a scan or reading]. Below, these codes are called a "linear bar code." Moreover, below, "a scan" means detecting existence of a bar code symbol and obtaining the electric display of the optical pattern of the symbol. "Reading" means scanning a symbol, decoding the electric display and generating the information in the standardized format. ASCII is an example of the standardized format in which an output by the decoder is possible. The "independence type" used below does not eliminate the case where it connects with the communication wire to the case where a bar code reader is connected to an external power, or an external host.

[0003] Recently, increasing the content of information of the graphical image like a bar code symbol which a machine can read is proposed very much by encoding data to the two-dimensional bar code symbol by which data are arranged by the train and the line. These codes are often arranged by the matrix-like fixed width-of-face pattern. code one (Code One) -- four command characters and the pad character -- adding -- ASCII -- all -- it is the two-dimensional matrix symbol which can encode 256 characters. This symbol has ten different versions defined with 27-50% of the symbol alphabetic character assigned to error detection and correction. Some versions use the Lead Solomon (Reed-Solomon) error control.

[0004] Other two-dimensional bar code symbols are PDs417. PD417 is explained by Wong's (Wang) U.S. Pat. No. 5,243,655. When it summarizes simply, PD417 is the special two-dimensional (17 4) symbol of the family (n, k) of a bar code. At PD417, a codeword is formed by 17 bits which consists of combination from which Bar of four trains which form many legal patterns, and the tooth space between four trains differ. Each tooth space and the width of face of each bar can change in the unit of the arbitration of 1-6, as long as the total number of unit in a codeword is 17. In PDF417, an exclusive subset or an exclusive cluster is used for three each other of a set of a legal pattern, and each cluster contains 29 codewords. Each of a codeword can be arranged by t sequence (t-sequence), and the map of the pattern within t sequence is carried out to the desired alphabet with a suitable translation table.

[0005] Each line of a PDF symbol is equipped with the codeword chosen from one of the three clusters, and three subsets are periodically used by the line writing direction. The specific cluster to which a codeword belongs can be identified by calculating the discriminator ability shown below.

$(X) = (X1 - X3 + X5 - X7) \bmod 9$ , however X are the mark patterns of a codeword, X1, X3, X5, and X7 express the width of face of Bar in the pattern, and it is X2, X6, and X8. The width of face of a tooth space is expressed. Although nine clusters are possible, in PDF417, three [0, 3, and 6], i.e., clusters, are used actually.

[0006] There are a start pattern, a left row indicator codeword, data-code WORD, a right row indicator codeword, and a stop codeword in each line of a PDF symbol. Error correction information can be included in data-code WORD. The line indicator codeword contains the number of the lines in the information about the configuration of a symbol especially a line number, and a symbol, the number of data lines, and the level of security. All these information is included in not all line indicator codewords, and that information is distributed in the shape of a pattern every three lines.

[0007] During a scan, a scanner can identify the cluster of a specific codeword and, as a result, can identify the line

during a scan in the time of the scan shaft having not aligned thoroughly in the line of a symbol. Mapping [ in a matrix or memory ]-by detection of crossover of line-"SUTITCHINGU of scan (stitching)", i.e., partial row scanning, \*\* becomes possible. Since data are expressed to redundancy within the symbol, or since an error correction algorithm like the Lead Solomon (Reed-Solomon) code is used, the part which is missing in the matrix completed selectively can be filled by other scan data of a line which is probably completely different. The typical scan SUTITCHINGU method is indicated by U.S. Pat. No. 5,241,164 of pub RIDISU and others (Pavlidiset al.).

[0008] In some conventional techniques, in order to collect data and for this to read from most of all fields, the relative movement between a scanner and a two-dimensional symbol is required. Read-out of PDF417 code may be performed by the learned approach of a single-character single character according to 2 step process. At the first step, the discriminator ability is calculated by a codeword being scanned. The first step is completed by identifying the cluster of a codeword and determining the value of t sequence for the identified cluster. In decoding of the 2nd step or higher level, error detection and correction are performed and the member of the alphabet subsequently encoded within the symbol is obtained from t sequence using a look-up table etc.

[0009]

[Problem(s) to be Solved by the Invention] The current problem in this technical field is that the computer resource which takes the bar code symbol of PDF417 to read within [ acceptable ] time amount is comparatively large, and needs a bulk memory and a large processing power. generally because of [ for work of the calculating machine contained in the error detection and correction of many alphabetic characters (up to 928 characters per one symbol) ] the data that the set of an alphabetic character is larger than the usual 8-bit symbol, it is used to decoding of PDF417 -- it is comparatively alike and the complicated computer has the at least 16-bit processor highly. The 16-bit processor is farther [ than the 8 bit microprocessor looked at by the portable bar code reader of a commercial scene like above-mentioned ST3000 now ] expensive. Furthermore, a 16-bit processor needs mass memory for decoding the symbol of PDF417, and its consumption power is too larger than the practical power in a cheap portable bar code reader. Consequently, in order to complete decoding, the unload of the data which are not decoded needed to be carried out to a remote decoder like a desktop computer, a risk (RISK), or a digital signal processor from the bar code scanner. This needs a communication link further between a decoder and a bar code scanner, in order to perform error detection and correction. Consequently, it is complicated to equip with a portable two-dimensional bar code reader with a cash register or a POS (point of sale) terminal, and it is attached at an expensive price. A facility of many retail stores cannot bear the cost by the hardware of an addition to the tooth space of the addition for a remote decoder, either.

[0010] Therefore, the main object of this invention is offering the bar code reader of the independence type which can read promptly a two-dimensional bar code symbol like PDF417. Other objects of this invention are things which were suited so that a two-dimensional bar code symbol might be scanned and decoded and which offer electronic and the portable hand carry type bar code reader including the description of calculating-machine-structure of a full independence type.

[0011] The object of further others of this invention is to perform efficiently a scan and decoding of a two-dimensional bar code reader symbol using a cheap microcomputer by the minimum memory and small [ of power consumption ].

[0012]

[Means for Solving the Problem] The above-mentioned object and other objects of this invention suit PDF417 symbol containing the light source, a photodetector, and a decoder and are portable, are hand carry types, and are attained by the two-dimensional bar code reader of an independence type. This decoder had 64 K bytes of address space, and is equipped with the 8-bit microcomputer which uses 8 K bytes of SRAM for data storage, and 32 K bytes of programmable erasable read-only memory (PEROM) for program instruction actually. The engine performance is strengthened by the new program made resident at the PEROM. Housing of this unit is 3 about 19.05x8.82x5.08cm [71/2x31 / 2 x2 legislation inch). It is 212.625g (7.5 unciae), and the weight turns OFF an average of 1.4W and uminescence during a scan during read-out actuation, and is 0.83W during decoding.

[0013] In one mode of this invention, the light source irradiates the narrow strip on a bar code symbol, and the visual field of a photodetector supports the strip. In other modes of this invention, a photodetector is a CCD matrix which acquires the image of the whole bar code symbol. In the mode of further others of this invention, a photodetector is a photodiode and the light source is raster rye gin grazer which scans a symbol in the form of a line writing direction.

[0014]

[Embodiment of the Invention] The example of this invention is explained below at a detail, referring to an attached drawing for a better understanding of the above-mentioned object of this invention, other objects, and many descriptions.

which suitable hardware equipped with this bar code reader 10 is available in a commercial scene as a model ST 3000-22 from Welch Alin, SUKANITERUZU Falls, and New York (Welch Allyn, Skaneateles Falls, New York), and this invention was indicated by this equipment by this application. A bar code reader 10 is the hand-held independence-type unit which can scan and decode a bar code symbol. This unit is the magnitude of 3 (10x4x3 legislation inch) 25.4x10.16x7.62cm, and its weight is good at 282.5g (10 unciae). However, preferably, it is 3 19.05x8.82x5.08cm (71/2 x31 / 2 x2 legislation inch), and during a scan, an average of 1.4W or less than [ it ], and luminescence are turned OFF, and it is 0.83W during decoding. Preferably, weight is 212.625g (7.5 unciae). As for this unit, width of face can resolve a 0.127mm (5 mils) bar code element.

[0015] The bar code reader 10 has two or more 660nm light emitting diode 8 (light source) 16 which irradiate the narrow strip of a bar code symbol 18 corresponding to the sensitization field of the usual optical system 15 and the photodetector of a unit. The lens system of optical system 15 is indicated by U.S. Pat. No. 5,291,008 by the applicant of this invention. The light which returned from the bar code symbol 18 through the suitable condenser lens 19 along with the light-receiving pass 14 collides with the photodetector realized as a charge coupling equipment (CCD) array 17. The CCD array 17 generates the analog signal showing the optical pattern of the perfect scanning line which crosses a bar code symbol. This analog signal passes accommodation and analog-to-digital conversion of a signal, and the signal processor 20 which digitizes. Digitization is indicated by these people's U.S. Pat. No. 5,294,783, and is realized using the analog reconstruction circuit quoted here for reference. The signal acquired as a result is the binary numeral of the bar code symbol by which reading appearance is carried out, and is supplied to a microcomputer 30.

[0016] A microcomputer 30 performs various tasks required for actuation of a system. A microcomputer 30 has 64 K bytes of address space including the microcontroller 40 realized as MC68HC11D0CFN3 made from Motorola. You may make it a microcomputer 30 have the address space which does not exceed 64 K bytes.

[0017] MC68HC11D0CFN3 has I/O of serial and parallel, an interruption logical circuit, an oscillator, and a clock logical circuit again. The microcontroller 40 adopted as the microcomputer 30 accesses the 8-K byte static RAM 42 and 32-K byte PEROM45. You may make it a static RAM 42 have the capacity which does not exceed 8 K bytes for data storage. Moreover, you may make it PEROM45 have the capacity which does not exceed 32 K bytes. The capacity of a microcontroller is reinforced by various functions ASIC 35.

[0018] As shown in drawing 2, ASIC35 has four basic function blocks. The CCD clock control section 43 makes it possible to switch the scan speed of the CCD array 17 between 50, 100, and 200 scans / second through a line 36, and controls a CCD array further to become desirable because of the optimal scan. A memory management unit 46 (MMU) gives the limited memory management capacity. It connects with the signal processor 20 by the line 38, and a timer / Direct-Memory-Access (DMA) channel 48 captures the input signal for continuing decoding automatically. Thereby, as for a microcontroller 40, the pattern analysis for decoding of a bar code symbol is attained. The common interface unit 44 performs the free communication link interface for a bar code reader 10 through a line 37 at the end. The ASIC35 whole is controlled by the microcontroller 40 through an internal bus 39.

[0019] The internal clock of a microcontroller 40 is controlled by the oscillator which has Xtal 49 through ASIC35. Since the engine performance of a system is increased, and in order to deal with the heavy load of the calculating machine imposed by decoding of PDF417 symbol, 7.3728MHz Xtal with which 3000 to ST22 model which does not deform is equipped was replaced with Xtal with a frequency of 14.7456MHz. Other deformation over 3000 to BASIC ST22 model is as follows.

[0020] A static RAM (SRAM) 42 is 8Kx8CMOS for 70ns. It is RAM (part number CXK5864BM-70L of Sony). A microcontroller (microprocessor) 40 is MC68HC11D0CFN3 of Motorola. PEROM45 is a model for 90ns (AT29C 256-9 of ATOMERU (ATMEL)).

[0021] In the permutation of the above-mentioned components, although SRAM, a microprocessor, and PEROM secure the dependability of a component by having increased the clock frequency, it becomes the most important contribution to the engine performance to double the frequency of Xtal. The firmware in PEROM45 includes the instruction in which the activation for a microcontroller 40 is possible. A part of program realized within PEROM45 is the conventional thing, and the bar code reader 10 is enabled to function as a conventional automatic distinction reader to a linear bar code.

[0022] Roughly, as shown in drawing 3, the firmware 60 consists of four Maine blocks. Various system monitoring functions shown with a reference number 62 include the monitor of I/O between control and sequencing of initialization of volatile hardware and a memory area, a scan, and actuation of decoding and a bar code reader and an operator, and an external device, and maintenance.

[0023] The decoding function shown with a reference number 64 is performed in some phases. If a bar code symbol is

related. A character string's decoded error checking is performed to a degree, and the alphabetic character decoded at the end determines the data message which is interpreted and corresponds. In the case of a linear symbol, the decoding result from one scan is a message for transmission. In a two-dimensional symbol like PDF417, a decoding result is partial information combined with the result of the decoding actuation which is stored in the static random-access-memory (SRAM) array 42 ( drawing 1 ), and follows behind. The menu facility shown with a reference number 66 is a routine called according to decoding of a specific bar code symbol, and is the so-called bar code "a menu" which sets a non-volatilized bit or a value in the arrangement field where PEROM45 was specified, and manages the operating characteristic of a bar code reader 10 of enabling decoding of a scan speed, a bell volume, scan mode (a manual or automatic trigger), and a special bar code symbol, and others.

[0024] Communication facility 68 contains a protocol required to offer hardware and hand over the scanned data to mounting equipment. The bar code reader 10 is supporting much the communications protocols and interfaces containing the terminal and keyboard of a laser output, OCIA, OCR, RS-232, and various commercial scenes, and, as for current, only the RS-232 interface is programmed in it.

[0025] Equipment like a bar code reader 10 could decode PDF417 bar code symbol because the firmware 60 for decoding existed in PEROM45. The object code of a firmware is indicated from 1 of the following table 1 without the place left to list No.1 shown in 38 of a table 1.

0064] List No.1 is the well-known Intel hex format (Intel Hex format).

It is given by NNAAAATTPPPPPPPPPPPPPPPPPPPCC. However, for program byte-count;AAAA of the line, the st program cutting tool's address;TT is [ NN ] the type of data ;P P is a checksum [ as opposed to the whole line in program cutting tool; and CC ].

0065] Install to PEROM45 of list No.1 is performed using the loading program shown from 1 of a table 2 by list No.2 shown in 3 of a table 2.

0069] List No.2 are performed according to the technique of the common knowledge specified by Motorola. ST 3000-2 is connected to the compatible personal computer employed by COM1 (trademark) or DOS of IBMPC which has list No.1 which has first list No.2 carried in BASIC INTAPURITA, and can be used by the file. ST 3000-22 is upgraded in bootstrap mode. Subsequently, if the depression of the trigger of ST 3000-22 is carried out, list No.2 will be performed

within a personal computer. At the depression of key of the operation of a personal computer is carried out, instant of the download program inside [ RAM ] a microcontroller 40 (MC68HC11D0CFN3) (not shown) will begin. A user answers the prompt of the input of the identifier of the file which subsequently contains list No.1. Subsequently to in PEROM45, list No.1 is downloaded directly.

[0070] The firmware 60 by this invention operates on PDF417 using 2 step process. The 1st step performed with a microcomputer 30 according to the instruction in list No.1 is decoding of a train. This step resembles linear bar code read-out, and includes arrangement of a series of PDF417 symbol alphabetic characters which adjoin a start or a STOP statement character. It is because "scan SUTITCHINGU" which comes to be just able to perform decoding after the scan which moves different space became possible that PDF417 became powerful in nearby calculating machine from the scan of a code 39 or a linear bar code like UPC. Furthermore, since the dimension of PEROM45 is limited, 17 large nodule alphabetic characters in large PDF417 character set make the usual lookup processing impossible. One or more nvalid character patterns will be seen [ hear / I / \*\*\*\*\* ], and there is difficulty produced in scan SUTITCHINGU always, when scan pass slides to the following line from one line. Such a pattern may not have even a proper number of elements. Nevertheless, once shift of space is performed, it is still required to take up the decoding process in the continuing effective alphabetic character. Since the data that all alphabetic characters start a line with the shift to Bar from the tooth space crossed and arranged are used for this decoding process, even when a scan shifts by space, it can recognize a start about each character position.

[0071] It is arranged in the suitable location of the matrix of the train as which decoding of a message or an array is performed and decoded PDF of 417 characters expresses a symbol in the 2nd step, and a line. Subsequently, error checking of the multi-line considered as a single string chain string is carried out, the error correction of it is carried out and it is decoded by the message encoded at the end. These all are performed within the limits of SRAM42 of 8K. The decoded information is outputted through the conventional communication link interface 55. A user interface 50 provides an operator with progress of a scan, and the display with the audio-visual result. Such an interface is indicated by the J.S. application serial number 08th under continuation by the same applicant as this application / No. 137,640.

[0072] Reading of the bar code symbol of some common knowledge which carries out automatic distinction and contains JPC is possible for a bar code reader 10. This equipment is used whether the bar code symbol 18 which is PDF417 symbol and obtains a bar code reader 10 is touched, and by making it approach and arranging. As for a bar code reader 10, aligning mostly in the line of a symbol is desirable. Subsequently, it can be started by carrying out the depression of the manual trigger, or read-out can be changed to this, and a bar code reader 10 can detect existence of a bar code symbol 18 and self-actuation. An operator is informed of read-out being effective by the advance notice machine which a lug hears.

[0073] Example 1: reading appearance of the standard PDF symbol (shown to drawing 6 by the reference number 00,500,600 from drawing 4 ) was repeatedly carried out using the above-mentioned example in 30 seconds. it explained above -- as -- "-- reading appearance -- carrying out -- " -- all actuation including the output of the information by which bar code information was scanned, decoded and decoded is said. In this example, the read-out head of a hand-held bar code reader contacted the data carrier, was maintained, and had aligned on the shaft of the train of a bar code symbol. There was no inclination to the flat surface of a data carrier. The lighting conditions of a surrounding chamber existed. The decoded information is shown as alphabetic character sequences 410, 510, and 610. This result is shown in a table 3.

[0075] For the comparison, this experiment was repeated using the two-dimensional hand carry type bar code reader of the conventional technique available now connected to the remote decoder. The system of this conventional technique used the microprocessor more powerful than 68HC11. This result is shown in a table 4.

[0076]

[0077] Although there are only few impressions slightly in the engine performance than the conventional bar code reader, the result depended on this invention is clearly simpler than conventional equipment, and is performed by cheap equipment small.

In example 2 drawing 7, some outlines of the 2nd example of this invention are shown, and the same reference number is given to the parts of drawing 1 and drawing 2, and resemblance. In this example, the photodetector has the same outline configuration as the 1st example except for realizing by the two-dimensional CCD matrix 117 equipped with not linear CCD array but an element called 120-120. A CCD array acquires simultaneously the image of the whole two-dimensional bar code symbol 18 during a scan. The signal generated by the two-dimensional CCD matrix 117 is multiplexed by the multiplexer (MUX) 125 in the form of a line writing direction, and, subsequently to a signal processor 20, is connected. In this way, a multiplexer is used, the two-dimensional CCD matrix 117 in a single scan can emulate two or more scans performed by the linear CCD array 17 of the 1st example, the signal format can be thoroughly accepted in a signal processor 20 and a microcomputer 30, and both detect the same signal as the signal generated by the linear CCD array.

[0078] Drawing 8 explains the 3rd example of the 3rd example this invention. In this example, the light source 116 has the same outline configuration as the 1st example except for the point which is the beam deflection machine 140 which is the raster ring laser realized as a laser light source 116, a revolution or an oscillating mirror, or bimorph. Raster ring laser is common knowledge in this technical field. Laser beam deflection equipment is indicated by U.S. Pat. No. 4,251,798 of for example, SUWARUTO and others (Swart et al.). Raster ring laser operates with one or more photodetectors 17, and is shown by the arrow head in a box 115, when the beam deflection machine 140 vibrates a laser beam 122 to horizontal

and a perpendicular direction, a bar code symbol is irradiated in the form of a line writing direction, and is scanned. According to above-mentioned U.S. Pat. No. 5,241,164, if scan SUTITCHINGU is adopted, the misalignment of the scanning line will be allowed.

[0079] Although this invention has been explained with reference to the structure indicated here, it is not limited to the indicated detail structure and means that the application covers the correction and deformation of arbitration which are produced within a patent claim.

**PRIOR ART**

[Description of the Prior Art] The bar code reader of an independence type is well known for this field. The newest example is the model of ST3000 proposed by these people. This kind of bar code reader has the microcomputer [ reading / a linear bar code symbol like the UPC code currently used widely at the supermarket or the similar retail store or a code 39 / microcomputer / a scan or reading ]. Below, these codes are called a "linear bar code." Moreover, below, "a scan" means detecting existence of a bar code symbol and obtaining the electric display of the optical pattern of the symbol. "Reading" means scanning a symbol, decoding the electric display and generating the information in the standardized format. ASCII is an example of the standardized format in which an output by the decoder is possible. The "independence type" used below does not eliminate the case where it connects with the communication wire to the case where a bar code reader is connected to an external power, or an external host.

[0003] Recently, increasing the content of information of the graphical image like a bar code symbol which a machine can read is proposed very much by encoding data to the two-dimensional bar code symbol by which data are arranged by the train and the line. These codes are often arranged by the matrix-like fixed width-of-face pattern. code one (Code One) -- four command characters and the pad character -- adding -- ASCII -- all -- it is the two-dimensional matrix symbol which can encode 256 characters. This symbol has ten different versions defined with 27-50% of the symbol alphabetic character assigned to error detection and correction. Some versions use the Lead Solomon (Reed-Solomon) error control.

[0004] Other two-dimensional bar code symbols are PDs417. PD417 is explained by Wong's (Wang) U.S. Pat. No. 5,243,655. When it summarizes simply, PD417 is the special two-dimensional (17 4) symbol of the family (n, k) of a bar code. At PD417, a codeword is formed by 17 bits which consists of combination from which Bar of four trains which form many legal patterns, and the tooth space between four trains differ. Each tooth space and the width of face of each bar can change in the unit of the arbitration of 1-6, as long as the total number of unit in a codeword is 17. In PDF417, an exclusive subset or an exclusive cluster is used for three each other of a set of a legal pattern, and each cluster contains 929 codewords. Each of a codeword can be arranged by t sequence (t-sequence), and the map of the pattern within t sequence is carried out to the desired alphabet with a suitable translation table.

[0005] Each line of a PDF symbol is equipped with the codeword chosen from one of the three clusters, and three subsets are periodically used by the line writing direction. The specific cluster to which a codeword belongs can be identified by calculating the discriminator ability shown below.

$f(X) = (X_1 - X_3 + X_5 - X_7) \bmod 9$ , however X are the mark patterns of a codeword,  $X_1$ ,  $X_3$ ,  $X_5$ , and  $X_7$  express the width of face of Bar in the pattern, and it is  $X_2$ ,  $X_6$ , and  $X_8$ . The width of face of a tooth space is expressed. Although nine clusters are possible, in PDF417, three [ 0, 3, and 6 ], i.e., clusters, are used actually.

[0006] There are a start pattern, a left row indicator codeword, data-code WORD, a right row indicator codeword, and a stop codeword in each line of a PDF symbol. Error correction information can be included in data-code WORD. The line indicator codeword contains the number of the lines in the information about the configuration of a symbol especially a line number, and a symbol, the number of data lines, and the level of security. All these information is included in not all line indicator codewords, and that information is distributed in the shape of a pattern every three lines.

[0007] During a scan, a scanner can identify the cluster of a specific codeword and, as a result, can identify the line identification modulo 3. This local line identification is convenient especially when the shift between two lines occurs during a scan in the time of the scan shaft having not aligned thoroughly in the line of a symbol. Mapping [ in a matrix or memory ]-by detection of crossover of line-"SUTITCHINGU of scan (stitching)", i.e., partial row scanning, \*\* becomes possible. Since data are expressed to redundancy within the symbol, or since an error correction algorithm like the Lead Solomon (Reed-Solomon) code is used, the part which is missing in the matrix completed selectively can be filled by other scan data of a line which is probably completely different. The typical scan SUTITCHINGU method is indicated

by U.S. Pat. No. 5,241,164 of pub RIDISU and others (Pavlidiset al.).

[0008] In some conventional techniques, in order to collect data and for this to read from most of all fields, the relative movement between a scanner and a two-dimensional symbol is required. Read-out of PDF417 code may be performed by the learned approach of a single-character single character according to 2 step process. At the first step, the discriminator ability is calculated by a codeword being scanned. The first step is completed by identifying the cluster of a codeword and determining the value of t sequence for the identified cluster. In decoding of the 2nd step or higher level, error detection and correction are performed and the member of the alphabet subsequently encoded within the symbol is obtained from t sequence using a look-up table etc.

**TECHNICAL PROBLEM**

---

[Problem(s) to be Solved by the Invention] The current problem in this technical field is that the computer resource which takes the bar code symbol of PDF417 to read within [ acceptable ] time amount is comparatively large, and needs a bulk memory and a large processing power. generally because of [ for work of the calculating machine contained in the error detection and correction of many alphabetic characters (up to 928 characters per one symbol) ] the data that the set of an alphabetic character is larger than the usual 8-bit symbol, it is used to decoding of PDF417 -- it is comparatively alike and the complicated computer has the at least 16-bit processor highly. The 16-bit processor is farther [ than the 8 bit microprocessor looked at by the portable bar code reader of a commercial scene like above-mentioned ST3000 now ] expensive. Furthermore, a 16-bit processor needs mass memory for decoding the symbol of PDF417, and its consumption power is too larger than the practical power in a cheap portable bar code reader. Consequently, in order to complete decoding, the unload of the data which are not decoded needed to be carried out to a remote decoder like a desktop computer, a risk (RISK), or a digital signal processor from the bar code scanner. This needs a communication link further between a decoder and a bar code scanner, in order to perform error detection and correction. Consequently, it is complicated to equip with a portable two-dimensional bar code reader with a cash register or a POS (point of sale) terminal, and it is attached at an expensive price. A facility of many retail stores cannot bear the cost by the hardware of an addition to the tooth space of the addition for a remote decoder, either.

[0010] Therefore, the main object of this invention is offering the bar code reader of the independence type which can read promptly a two-dimensional bar code symbol like PDF417. Other objects of this invention are things which were suited so that a two-dimensional bar code symbol might be scanned and decoded and which offer electronic and the portable hand carry type bar code reader including the description of calculating-machine-structure of a full independence type.

[0011] The object of further others of this invention is to perform efficiently a scan and decoding of a two-dimensional bar code reader symbol using a cheap microcomputer by the minimum memory and small [ of power consumption ].

**MEANS**

[Means for Solving the Problem] The above-mentioned object and other objects of this invention suit PDF417 symbol containing the light source, a photodetector, and a decoder and are portable, are hand carry types, and are attained by the two-dimensional bar code reader of an independence type. This decoder had 64 K bytes of address space, and is equipped with the 8-bit microcomputer which uses 8 K bytes of SRAM for data storage, and 32 K bytes of programmable erasable read-only memory (PEROM) for program instruction actually. The engine performance is strengthened by the new program made resident at the PEROM. Housing of this unit is 3 about 19.05x8.82x5.08cm (71/2x31 / 2 x2 legislation inch). It is 212.625g (7.5 unciae), and the weight turns OFF an average of 1.4W and luminescence during a scan during read-out actuation, and is 0.83W during decoding.

[0013] In one mode of this invention, the light source irradiates the narrow strip on a bar code symbol, and the visual field of a photodetector supports the strip. In other modes of this invention, a photodetector is a CCD matrix which acquires the image of the whole bar code symbol. In the mode of further others of this invention, a photodetector is a photodiode and the light source is raster rye gin grazer which scans a symbol in the form of a line writing direction.

[0014]

[Embodiment of the Invention] The example of this invention is explained below at a detail, referring to an attached drawing for a better understanding of the above-mentioned object of this invention, other objects, and many descriptions.

The bar code reader 10 is shown in example 1 drawing 1 . It can carry out by adding modification of a certain kind by which suitable hardware equipped with this bar code reader 10 is available in a commercial scene as a model ST 3000-22 from Welch Alin, SUKANITERUZU Falls, and New York (Welch Allyn, Skaneateles Falls, New York), and this invention was indicated by this equipment by this application. A bar code reader 10 is the hand-held independence-type unit which can scan and decode a bar code symbol. This unit is the magnitude of 3 (10x4x3 legislation inch) 25.4x10.16x7.62cm, and its weight is good at 282.5g (10 unciae). However, preferably, it is 3 19.05x8.82x5.08cm (71/2 x31 / 2 x2 legislation inch), and during a scan, an average of 1.4W or less than [ it ], and luminescence are turned OFF, and it is 0.83W during decoding. Preferably, weight is 212.625g (7.5 unciae). As for this unit, width of face can resolve a 0.127mm (5 mils) bar code element.

[0015] The bar code reader 10 has two or more 660nm light emitting diode 8 (light source) 16 which irradiate the narrow strip of a bar code symbol 18 corresponding to the sensitization field of the usual optical system 15 and the photodetector of a unit. The lens system of optical system 15 is indicated by U.S. Pat. No. 5,291,008 by the applicant of this invention. The light which returned from the bar code symbol 18 through the suitable condenser lens 19 along with the light-receiving pass 14 collides with the photodetector realized as a charge coupling equipment (CCD) array 17. The CCD array 17 generates the analog signal showing the optical pattern of the perfect scanning line which crosses a bar code symbol. This analog signal passes accommodation and analog-to-digital conversion of a signal, and the signal processor 20 which digitizes. Digitization is indicated by these people's U.S. Pat. No. 5,294,783, and is realized using the analog reconstruction circuit quoted here for reference. The signal acquired as a result is the binary numeral of the bar code symbol by which reading appearance is carried out, and is supplied to a microcomputer 30.

[0016] A microcomputer 30 performs various tasks required for actuation of a system. A microcomputer 30 has 64 K bytes of address space including the microcontroller 40 realized as MC68HC11D0CFN3 made from Motorola. You may make it a microcomputer 30 have the address space which does not exceed 64 K bytes.

[0017] MC68HC11D0CFN3 has I/O of serial and parallel, an interruption logical circuit, an oscillator, and a clock logical circuit again. The microcontroller 40 adopted as the microcomputer 30 accesses the 8-K byte static RAM 42 and 32-K byte PEROM45. You may make it a static RAM 42 have the capacity which does not exceed 8 K bytes for data storage. Moreover, you may make it PEROM45 have the capacity which does not exceed 32 K bytes. The capacity of a

microcontroller is reinforced by various functions ASIC 35.

[0018] As shown in drawing 2, ASIC35 has four basic function blocks. The CCD clock control section 43 makes it possible to switch the scan speed of the CCD array 17 between 50, 100, and 200 scans / second through a line 36, and controls a CCD array further to become desirable because of the optimal scan. A memory management unit 46 (MMU) gives the limited memory management capacity. It connects with the signal processor 20 by the line 38, and a timer / Direct-Memory-Access (DMA) channel 48 captures the input signal for continuing decoding automatically. Thereby, as for a microcontroller 40, the pattern analysis for decoding of a bar code symbol is attained. The common interface unit 44 performs the free communication link interface for a bar code reader 10 through a line 37 at the end. The ASIC35 whole is controlled by the microcontroller 40 through an internal bus 39.

[0019] The internal clock of a microcontroller 40 is controlled by the oscillator which has Xtal 49 through ASIC35. Since the engine performance of a system is increased, and in order to deal with the heavy load of the calculating machine imposed by decoding of PDF417 symbol, 7.3728MHz Xtal with which 3000 to ST22 model which does not deform is equipped was replaced with Xtal with a frequency of 14.7456MHz. Other deformation over 3000 to BASIC ST22 model is as follows.

[0020] A static RAM (SRAM) 42 is 8Kx8CMOS for 70ns. It is RAM (part number CXK5864BM-70L of Sony). A microcontroller (microprocessor) 40 is MC68HC11D0CFN3 of Motorola. PEROM45 is a model for 90ns (AT29C 256-9 of ATOMERU (ATMEL)).

[0021] In the permutation of the above-mentioned components, although SRAM, a microprocessor, and PEROM secure the dependability of a component by having increased the clock frequency, it becomes the most important contribution to the engine performance to double the frequency of Xtal. The firmware in PEROM45 includes the instruction in which the activation for a microcontroller 40 is possible. A part of program realized within PEROM45 is the conventional thing, and the bar code reader 10 is enabled to function as a conventional automatic distinction reader to a linear bar code.

[0022] Roughly, as shown in drawing 3, the firmware 60 consists of four Main blocks. Various system monitoring functions shown with a reference number 62 include the monitor of I/O between control and sequencing of initialization of volatile hardware and a memory area, a scan, and actuation of decoding and a bar code reader and an operator, and an external device, and maintenance.

[0023] The decoding function shown with a reference number 64 is performed in some phases. If a bar code symbol is detected, it will be carried out in the field in which the decoding actuation for every detailed alphabetic character is related. A character string's decoded error checking is performed to a degree, and the alphabetic character decoded at the end determines the data message which is interpreted and corresponds. In the case of a linear symbol, the decoding result from one scan is a message for transmission. In a two-dimensional symbol like PDF417, a decoding result is partial information combined with the result of the decoding actuation which is stored in the static random-access-memory (SRAM) array 42 (drawing 1), and follows behind. The menu facility shown with a reference number 66 is a routine called according to decoding of a specific bar code symbol, and is the so-called bar code "a menu" which sets a non-volatilized bit or a value in the arrangement field where PEROM45 was specified, and manages the operating characteristic of a bar code reader 10 of enabling decoding of a scan speed, a bell volume, scan mode (a manual or automatic trigger), and a special bar code symbol, and others.

[0024] Communication facility 68 contains a protocol required to offer hardware and hand over the scanned data to mounting equipment. The bar code reader 10 is supporting much the communications protocols and interfaces containing the terminal and keyboard of a laser output, OCIA, OCR, RS-232, and various commercial scenes, and, as for current, only the RS-232 interface is programmed in it.

[0025] Equipment like a bar code reader 10 could decode PDF417 bar code symbol because the firmware 60 for decoding existed in PEROM45. The object code of a firmware is indicated from 1 of the following table 1 without the place left to list No.1 shown in 38 of a table 1.

[0026]

**DESCRIPTION OF DRAWINGS**

---

**[Brief Description of the Drawings]**

[Drawing 1] It is the block diagram of the suitable bar code reader for operation of this invention.

[Drawing 2] a part of drawing 1 -- it is an enlarged drawing.

[Drawing 3] It is the block diagram showing the program structure of the computer in the bar code reader shown in drawing 1.

[Drawing 4] It is standard PDF417 bar code symbol which has an amount with information, and level with the error correction encoded in it.

[Drawing 5] It is standard PDF417 bar code symbol which has other informational amounts and other level with the error correction encoded in it.

[Drawing 6] It is standard PDF417 bar code symbol which has the informational amount of further others, and the level of further others of the error correction encoded in it.

[Drawing 7] It is the schematic diagram of the 2nd example of this invention.

[Drawing 8] It is the schematic diagram of the 3rd example of this invention.

**[Description of Notations]**

16 -- Light source

17 -- Photodetector (linear CCD array)

40 -- Microcontroller (decoder)

42 -- Static RAM (the 2nd part)

45 -- PEROM (the 1st part)

64 -- Decoding function (decoder)

116 -- Raster yie gin grazer

117 -- Two-dimensional CCD matrix

[Procedure amendment]

[Filing Date] January 9, Heisei 15 (2003. 1.9)

[Procedure amendment 1]

[Document to be Amended] Description

[Item(s) to be Amended] Claim 4

[Method of Amendment] Modification

[Proposed Amendment]

[Claim 4] Said microcomputer (30) is the bar code reader of the independence type according to claim 1 which has 64 K bytes or less of address space.

[Procedure amendment 2]

[Document to be Amended] Description

[Item(s) to be Amended] Claim 5

[Method of Amendment] Modification

[Proposed Amendment]

[Claim 5] Said 1st part (45) of said memory (42 45) is the bar code reader of an independence type [ equipped with the read only memory (45) with the capacity of 32 K bytes or less ] according to claim 4.

[Procedure amendment 3]

[Document to be Amended] Description

[Item(s) to be Amended] Claim 6

[Method of Amendment] Modification

[Proposed Amendment]

[Claim 6] Said 2nd part (42) of said memory (42 45) is the bar code reader of an independence type [ equipped with random access memory (42) with the capacity of 8 K bytes or less for data storage ] according to claim 4.

[Procedure amendment 4]

[Document to be Amended] Description

[Item(s) to be Amended] Claim 12

[Method of Amendment] Modification

[Proposed Amendment]

[Claim 12] A bar code reader is a portable hand carry type two-dimensional bar code reader according to claim 11 which consumes 1.4W or less on an average, and has the weight of 225g or less during read-out actuation.

[Procedure amendment 5]

[Document to be Amended] Description

[Item(s) to be Amended] 0004

[Method of Amendment] Modification

[Proposed Amendment]

[0004] Other two-dimensional bar code symbols are PDs417. PD417 is explained by Wong's (Wang) U.S. Pat. No. 5,243,655. When it summarizes simply, PD417 is the special two-dimensional (17 4) symbol of the family (n, k) of a bar code. At PD417, a codeword is formed by 17 bits which consists of combination from which Bar of four trains which form many legal patterns, and the tooth space between four trains differ. Each tooth space and the width of face of each bar can change in the unit of the arbitration of 1-6, as long as the total number of unit in a codeword is 17. In PDF417, an exclusive subset or an exclusive cluster is used for three each other of a set of a legal pattern, and each cluster contains 929 codewords. Each of a codeword can be arranged by t sequence (transfer sequence), and the map of the pattern within t sequence is carried out to the desired alphabet with a suitable translation table. In addition, t sequence is a sequence of the transition used in order to encode the data in a bar code symbol, for example, is a sequence of a tooth space etc. from Bar/Bar from a tooth space/tooth space from Bar.

[Procedure amendment 6]

[Document to be Amended] Description

[Item(s) to be Amended] 0024

[Method of Amendment] Modification

[Proposed Amendment]

[0024] Communication facility 68 contains a protocol required to offer hardware and hand over the scanned data to mounting equipment. The bar code reader 10 is supporting much the communications protocols and interfaces containing the terminal and keyboard of an optical character interface adapter laser output, (OCIA), OCR, RS-232, and various commercial scenes, and, as for current, only the RS-232 interface is programmed in it.
